Research Statement

Marius Savatier

Let's be short. I'm still a young scholar. I believe that smart speculators do not know fundamental value. Dynamically, they cannot distinguish noise from information, and noise can accumulate in prices without necessarily leading to predictable returns. Easy to say, hard to study. My idea is to focus on partial-replication settings, where the missing piece prevents real-time verification of mispricing unless one has a valuation model. Ex-post, however, I can measure whether the replicated component co-moved with its twin. I find large underreaction, driven by the uncertainty about the value of the non-replicated section: the greater the uncertainty, the stronger the underreaction.

My main inspirations are: Grossman [1976], Diamond and Verrecchia [1981], Shiller et al. [1984], Brav and Heaton [2002, 2003], Brav et al. [2004], Dávila and Parlatore [2023, 2025].
