Education

PhD in Finance (2020–2026) – Université Paris Dauphine–PSL, France

Master 2 in Financial Economics (2019–2020) – Université Paris 1 Panthéon–Sorbonne, France

Master 1 in Financial Economics (2018–2019) – Université Paris 1 Panthéon–Sorbonne, France

Licence in Economics (2015–2018) – Université Paris 1 Panthéon–Sorbonne, France

Visiting Position

Visiting PhD Student, The Wharton School, University of Pennsylvania, September–October 2026
Host: Professor Itay Goldstein

Underreaction in Publicly Traded Cross-Holdings *Job Market Paper*

Arbitrage disciplines the relative values of assets. But how strong is this discipline when assets are not perfect substitutes? Answering this question is difficult because relative-value mispricing between imperfect substitutes cannot be measured without an asset pricing model. Public cross-holdings provide a unique setting in which it can: a publicly traded parent owns a stake in a publicly traded subsidiary alongside other untraded assets, so the two firms are imperfect substitutes, yet a $1 change in the value of the stake should translate one-for-one into the parent's market value. After isolating price movements specific to the subsidiary, I find that only 38 cents on the dollar, on average, pass through to the parent. In the rare cases where the parent has almost no other assets, pass-through is close to one-for-one, and it declines steeply as unhedgeable risk from the parent's other assets increases. The results suggest that inelastic investor demand allows non-fundamental flows to continuously move subsidiary prices, while relative-value arbitrage transmits these movements to the parent with a strength that weakens as unhedgeable risk rises.

The Reallocation of Information by Relative Value Arbitrage

This paper studies how relative-value arbitrage affects price informativeness. Two risky assets with correlated payoffs are traded on segmented markets, while relative-value arbitrageurs observe only prices and trade across both markets. Relative-value arbitrage generates two opposing effects on informativeness. An information-aggregation channel increases informativeness by incorporating information contained in the related price, while a noise-contamination channel decreases informativeness by transmitting noise from one price into the other through price alignment. The paper characterizes the level of arbitrageurs' risk-bearing capacity that maximizes informativeness. A calibration based on empirical estimates of price informativeness suggests that, even for moderate levels of arbitrage activity, the noise-contamination channel can outweigh the information-aggregation channel.

Teaching Experience

Coding for Finance (VBA) – Master 1 Level, Paris Dauphine–PSL (2020–2026)
Assisted Professor Fabrice Riva

Financial Econometrics – Master 1 Level, Paris Dauphine–PSL (2023–2026)
Delivered lectures alongside Professor Gaëlle Le Fol

International Finance – Master 1 Level, Paris Dauphine–PSL (2025–2026)
Delivered lectures alongside Professor Evgenia Passari

Languages

French: Native

English: Proficient (C1)

German: Proficient (C1)

Additional Skills

Coding: Python, R, SQL, and VBA
